The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1995-018287/03.

The electrophoresing the digested aggregate of cDNAs in separate lanes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
Analysis of cDNA and gene expression - by digestion with restriction enzymes.
                                                                                                                                          16-APR-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of a comprise of mRNAs and a plural type of a compression of the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic.

The method can be used to analyse gene expression rapidly and easily
                                           A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1995-018287/03.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-NOV-1994
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analysis; gene expression; reverse transcription; primer; cDNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                   Analysis of cDNA and gene expression - by digestion with restriction enzymes.
                                                                       WPI; 1995-018287/03.

                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abbilled reverse transcription primers (GENESEO files AAO75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate lanes. The method can be used to analyse gene expression rapidly and easily

                              A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GBNESEQ files AQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 á
                                                                                                                                                               This sequence represents a primer for T84, a reporter oligonucleotide for CC human chorionic gonadotropin and can be used in the method of the CC invention. The method of the invention is for detecting a target nucleic acid sequence (I) in a replication reaction. The method comprises: (i) CC replicating at least one (I) with a composition containing first label CC (L1) that can be incorporated into replicated nucleic acid and a CC detection probe (DP) consisting of a second label (L2), target domain and CC replication inhibiting domain that prevents the DP from participating in CC the replication reaction, to produce a hybrid of DP and at least one CC replicated (I); (ii) immobilising the hybrid through L1 or L2; and (iii) CC detecting presence of immobilised hybrid. The method is used with any CC replication process, including PCR in cells, e.g. for analysis of CC initical samples, foods, crops, soil, water etc. The method using a CC homogeneous detection probe system allows real-time monitoring of product formation and is not restricted by base composition of probes or primers, CC melting or annealing temperatures or PCR cycling conditions. The presence CC decrease yield, and eliminates the need for an additional hybridisation of CC unwanted sequences is reduced, electrophoresis is not required and CC products can be detected in several different formats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 319

                                                                                                                                                                                                                                                                                                          49C primer A was used with primer 339 reverse (see AAV30287) to amplify DNA (see AAV30294) coding for a portion of a novel toxin of Bacillus thuringiensis (B.t.) strain PS49C (NRRL B-21532). This novel toxin belongs to the novel SUP-1 family of B.t. soluble toxins that are active against lepidopteran pests. The PCR product is claimed for use as a PCR primer or hybridisation probe, and can be used to identify toxins and genes of the SUP-1 family. Disclosed and claimed are novel B.t. isolates, pesticidal toxins (see AAW60215-32), genes, nucleotide probes and primers (see AAV30288-321 and AAT99734-87), and transformed host cells that express these toxins. The invention provides 8 entirely new families of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacillus thuringiensis isolates - used for producing pesticidal toxins and nucleotide sequences for control of lepidopterans and coleopterans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Feitelson JS, Schnepf HE, Note Loewer D, Schwab G, Dullum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primers 1 and 2 (AAV32913) were used in a PCR reaction to amplify the bovine lactoferrin cDNA. The PCR product was used as a tail which was fused through a papsin recognition site to the 3° end of the Aspergillus niger beta-galactosidase gene. The invention provides a synthetic beta-galactosidase which differs from the natural occurring enzyme in being inactive in milk but capable of being activated by a chemical or condition naturally present in the gasrointestinal tract of humans. The design of this synthetic enzyme comprises of a tail domain fused to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              beta-galactosidase through a cleavage site. The presence of the tail domain renders the enzyme inactive and it can also be used as a purification handle. The synthetic beta-galactosidase is claimed to be able to hydrolyse lactose in vivo to overcome lactase intolerance and thereby reduce associated gastrointestinal disorders. The synthetic beta-galactosidase is also claimed to be useful in cheese making whereby it is activated by chymosin when added to milk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic beta-galactosidase inactive in milk but active in vivo - can chemically activated and used to treat lactose intolerance, also useful in cheese production.

                                                                                                                                                                                                                                                                              AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide specific targeting of bioactive molecules to cells. AAC78600 to AAC7887 represent PCR primers and probes used in the isolation of the

The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; inflammatory bowel disease; Crohn's disease; ulcerative colitis; single nucleotide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for determining whether a subject has CC predisposition for QT interval elongation when treated with one or more pharmaceutical agents. The method comprises screening a biological sample CC from the subject through a nucleic acid array containing probes for at CC elast two genetic mutations or polymorphisms chosen from long QT (LQT), CC altered sensitivity (MiRP1) or increased exposure (MDR, 9450 cytochrome) CC genes. The method is useful for determining whether a subject has a CC predisposition for QT interval prolongation when treated with one or more CC pharmaceutical agents. The method is useful for screening one or more CC pharmaceutical agents in vitro for their ability to induce prolonged CC cardiac repolarisation of a cell. The method is also useful for CC identifying genetic polymorphisms and mutations which are associated with CC intertifying genetic polymorphisms and mutations which are associated with CC intertifying genetic polymorphisms and mutations which are associated with CC intertifying persent sequence is a PCR primer used for genotyping human CC cytochrome P450 isoform CYP2D6 exon 3/4 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                            is at least 80 % sequence identity to, or the full-length coding sequence of, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated probe

The invention relates to an isolated secreted and transmembrane CC polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful CC in PRO polypeptide detection methods. The PRO polypeptide is useful for CC linking a bioactive molecule to a cell. The PRO polypeptide or an CC entibody against it is useful for modulating a biological activity of a CC cell. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO colypeptide is useful as a thrombolytic agent, interferon, CC colypeptide is useful as a thrombolytic agent, interferon, CC concer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, CC annear e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, CC amyotrophic lateral sclerosis; inflammatory disease e.g. asthma, CC atherosclerosis; neurodegenerative disease e.g. Aliheimer's disease, CC parkinson's disease; cardiovascular disease e.g. Aliheimer's disease, CC parkinson's disease; cardiovascular disease e.g. hypertension and CC glomerulonephritis; lung disease e.g. pulmonary hypertension and CC sowel disease; reproductive disorders e.g. gastric ulcer and inflammatory bowel disease; reproductive disorders e.g. premature labour and preeclampsis; carcinogenesis. The present sequence represents a PRO CC sequence data for this patent did not form part of the printed CC sequence data for this patent did not format directly from USPTO CC at sequence data or sequence.html?DocID-20020177553

        The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking ploactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The bioactive molecule maybe a toxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hyper- or hyper-insullnaemia, cardiac insufficiency, nervous system disorders, kidney disorders, bone and cartilage disorders or arthritis,
                                                                                                                                                                                                                                                                                                                                                          Ferrara

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tumours, and wound healing. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, for the genetic analysis of individuals with genetic disorders, and in gene therapy. The present sequence represents a probe used in the examples of the present invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web sit at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human

The invention relates to a new isolated nucleic acid molecule comprises a CC sequence with at least 80% identity to: (a) a nucleotide encoding any of 94 PRO polypeptides whose sequences are fully defined in the CC specification; or (b) any of 94 nucleotide sequences fully defined in the CC specification; or the full length coding sequence of any these 94 cC nucleotide sequences. Also included are an isolated PRO polypeptide sequences at least 80% positives when compared to any of the PRO polypeptide sequences cited above (or an isolated PRO polypeptide having CC polypeptide sequence identity to: (a) an amino acid sequence concoded by the nucleotide deposited with ATCC numbers listed in the CC specification; (b) the PRO polypeptide, lacking its associated signal peptide), a vector comprising the nucleic completide; or (c) an extracellular domain of the PRO polypeptide, with or CC lacking its associated signal peptide), a vector comprising the nucleic completide; a chimaeric molecule comprising the vector (and producing a PRO polypeptide), a chimaeric molecule comprising the pRO polypeptide fused to a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptide fused to a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptide fused to a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptide fused for cancers (e.g. ovarian cancer, concreting or treating e.g. malignancies or cancers (e.g. ovarian cancer, concreting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, arthritis, immune-mediated alopecia, stroke, encephalitis, hepatitis, or multiple sclerosis in mammals. The PRO polypeptides are useful in drug screening, psortiasis.

CC inflammatory disease, renal disease, arthritis, immune-mediated alopecia, tracers are useful and protective sequences of human cDNA, genomic DNA or mRNA. The PRO polypeptides are concerned to the presence of the protective and produced t
                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genes and secreted and transmembrane polypeptides (e.g. PRO337 or PRO1559), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, encephalitis, hepatitis or multiple sclerosis in mammals.
                                                                                                           Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 114; Page 192; 460pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for suppressing or modulating CC the expression of a selected gene in a cell. The method comprises controducing into the cell a molecule comprising a nucleic acid binding portion which binds to a site at or associated with the selected gene CC which site is present in a genome, and an expression repressor portion or a modifying portion. The nucleic acid binding portion comprises an CC oligonucleotide or oligonucleotide mimic or analogue. The repressor cC portion comprises a polypeptide or peptidomimetic. The modifying portion or CC also comprises a polypeptide or peptidomimetic that is capable of CC modulating covalent modification of nucleic acid or chromatin and is not CC using a complex of an oligonucleotide and a regulatory peptide. The cability to selectively suppress the expression of a gene is useful in controlling gene expression CC using a complex of an oligonucleotide and a regulatory peptide. The CC many areas of biology, such as in methods of treatment where the CC expression of the gene may be undesirable (e.g. cancer), in preparing CC models of disease and in modifying the phenotype in order to produce CC desirable properties. The molecule is useful in manufacturing an agent or CC a medicament for modulating or suppressing the expression of the selected CC gene in a patient or in an animal cell. The method is useful in gene CC charge.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and PRO739 are useful for detecting PRO1559 polypeptide in a sample, and PRO739 is useful for detecting PRO725, PRO700 and PRO739 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO4993 polypeptide. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO393 polypeptide. PRO3559 is useful for linking a bioactive molecule to a cell expressing a PRO4935, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739
                                                                                                                                                                                                                                                                                                                                                                    Human; secreted and transmembrane protein; PRO; cell death; neur peripheral neuropathy; diabetic peripheral neuropathy; PRO; cell death; neuropathy; AIDS-associated neuropathy; Charcot-Marie-Tooth disease; Refusum's disease; Abetalipoproteinaemia; Tangter disease; Krabbe's disease; Metachromatic leukodystrophy; Fabry's disease; Krabbe's disease; Metachromatic leukodystrophy; Fabry's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated PRO polypeptides for example extracellular, secreted and membrane bound proteins, useful for modulating the biological activities of cells and for treating, for example diabetes, cancer, rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO337, PRO1559, PRO700 or PRO739 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                          17-OCT-2001;

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, and for identifying agonists or antagonists. The bioactive molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refsum's disease, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                                                                                                                                                                                                                                                                                                                           Ferrara

neuropathy. muscle generation and secreted and transmembrane polypeptides and polynucleotides ing them, useful for treating wound healing, tissue growth and egeneration amyotrophic lateral sclerosis o õ

Example 114; SEQ ID NO 564; 472pp; English.

The invention describes an isolated secereted and transmembrane PRO CC polypeptide (I) PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various CC industrial applications. PRO polypeptide such as PRO200, PRO866, PRO703, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO865, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO865, PRO708, PRO300 is useful for the treatment of wound healing, tissue growth and CC muscle generation and regeneration. PRO37 is useful for treating camyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or diabetic peripheral neuropathy. A polynucleotide (II) encoding (I) is useful for generating transgenic animals or knockout animals which are useful for generating transgenic animals or knockout animals which are cuseful in the development and screening of therapeutically useful crelated PRO coding sequences, and to construct hybridisation probes for mapping the gene which encodes the PRO and for the genetic analysis of individuals with genetic disorders, for recombinantly expressing (I) and for chromosome identification. (I) is useful as molecular marker for protein electrophoresis purposes, and as therapeutic aspents. (I) is also useful for screening compounds to identify those that mimic the PRO polypeptide (antagonists). (I) and (II) are useful for tissue typing. PRO antibodies are useful in diagnostic assay of sample (CC fluids. Anti-PRO antibodies are useful in diagnostic assay for PRO e.g. detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural

New isolated secreted and transmembrane PRO polypeptides, useful in the preparation of a medicament for treating a condition responsive to the polypeptide, and as therapeutic agents e.g. vaccines. WPI; 2003-695924/66.

Example 114; SEQ ID NO 564; 467pp; English.

The invention relates to an isolated PRO polypeptide (secreted or CC transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal CC peptide, a PRO extracellular domain with or without its associated signal CC peptide, Also included are nucleic acids encoding the PRO proteins CC mentioned above, a vector comprising a PRO nucleic acid), a host cell CC comprising the vector and producing PRO, a chimaeric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO CC enclody. PRO337 polypeptide is useful for detecting aproay93 polypeptide is useful for detecting PRO4993 polypeptide is useful for detecting PRO4993 polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting CC PRO1559 polypeptide, and PRO1559 polypeptide is useful for linking a CC placetive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule could be caused death of the cell. PRO337 polypeptide is useful for linking a CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell. PRO337 polypeptide is useful for linking and CC causes death of the cell.

                                                                                                                                                                                                                                              The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequences as given to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody, PRO337 polypeptide is useful for detecting a PRO493 polypeptide. PRO735, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel secreted and transmembrane polypeptides, designated PRO polypeptides, and polynucleotides encoding them useful for transiency diseases, bone, cartilage and retinal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 114; SEQ ID NO 564; 468pp; English.

                                                                                                                                                                                                                                                                                         The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide in useful for detecting a PRO493 polypeptide in a sample suspected of containing PRO4931 polypeptide.

                                                                                    The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO300, PRO866, PRO703, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO860 or PRO846 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or
                                                                                                                                                                                                                                                                             Novel isolated secreted and transmembrane PRO polypeptides, useful preparation of a medicament for treating a condition responsive to polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                  Example 114; SEQ ID NO 564; 464pp; English.

```
Critical invention relates to an isolated PRO polypeptide (secreted or cransmembrane protein) having at least 80% amino acid sequence identity con in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins comprising the vector and producing PRO. a chimaeric molecule comprising Commentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO. a chimaeric molecule comprising Comprising the vector and producing PRO. a chimaeric molecule comprising CC shinlarly, PRO337 polypeptide is useful for detecting a PRO. 150 polypeptide. Similarly, PRO493 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO700 or PRO739 polypeptide is useful for detecting PRO359 polypeptide. PRO700 or PRO739 polypeptide are useful for Inking a bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule to a cell expressing PRO339 polypeptide is useful for Inking a bloactive molecule to a cell expressing PRO339 polypeptide. The bloactive molecule is useful for PRO739 polypeptide are useful for Inking a bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule co a cell expressing PRO337 polypeptide is useful for Inking a bloactive molecule to a cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide. PRO337 polypeptide is useful for modulating the pro339 polypeptide is useful for modulating the pro339 polypeptide is useful for modulating the pro339 polypeptide is useful fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-APR-1998;

The invention relates to an isolated PRO polypeptide (secreted or cc transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal cc peptide, a PRO extracellular domain with or without its associated signal comprise. Also included are nucleic acids encoding the PRO proteins comprising the vector romprising a PRO nucleic acid), a host cell ccomprising the vector and producing PRO, a chimaeric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO cc antibody. PRO337 polypeptide is useful for detecting a PRO493 cc polypeptide in a sample suspected of containing PRO493 polypeptide. CC Similarly, PRO493 polypeptide is useful for detecting PRO337 polypeptide, and PRO155 polypeptide is useful for detecting CC PRO155 polypeptide, and PRO155 polypeptide is useful for detecting CC PRO155, PRO700 or PRO739. PRO493 polypeptide is useful for detecting CC Delactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ashkenazi AJ, Baker KP,

PRO4993 polypeptide or anti-PRO337 polypeptide. PRO4993 polypeptide activity of the cell expressing PRO337 polypeptide, where the cell is killed. PRO337 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide or an anti-PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide or anti-PRO755, anti-PRO700 or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide or anti-PRO739 polypeptide is useful for inhibiting tumour growth, retinal disorders, sports-related joint problems, articular cartilage defects, osports-related joint problems, articular cartilage and hearing loss in mammals. The present sequence is a Tagman PCR probe used investigate PRO cross gene amplification in certain tumour cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

New secreted and transmembrane PRO nucleic acids and polypeptides, useful for stimulating the release of tumor necrosis factor alpha from human blood and stimulating the proliferation of differentiation of chondrocyte

Example 114; SEQ ID NO 564; 462pp; English.

The invention relates to an isolated PRO polypeptide (secreted or cransmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal competide, a PRO extracellular domain with or without its associated signal competide). Also included are nucleic acids encoding the PRO proteins comprising the vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising pRO fused to a heterologous amino acid sequence, and an anti-PRO comprising pRO polypeptide in a sample suspected of containing PRO4933 polypeptide. PRO735 polypeptide is useful for detecting a PRO4993 polypeptide. PRO735 polypeptide is useful for detecting PRO337 completely profite profits profits profits is useful for detecting pRO337 polypeptide. PRO735 polypeptide is useful for linking a profit ne cell expressing PRO1559 anti-PRO725, anti-PRO700

The polypeptides are useful for inhibiting tumour growth, retinal disorde sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis, wound healing and hearing los mammals. The present sequence is a Tagman PCR probe used investigate gene amplification in certain tumour cell lines.
                                                                                                        New genes, and its encoded secreted and transmembrane polypeptides, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated PRO polypeptide (secreted or CC transmembrane protein) having at least 80% amino acid sequence identity CC to an amino acid sequence from 94 fully defined sequences as given CC in the specification (including PRO lacking its associated signal competide, a PRO extracellular domain with our tits associated signal CC peptide). Also included are nucleic acids encoding the PRO proteins CC mentioned above, a vector comprising a PRO nucleic acid), a host cell CC comprising the vector and producing PRO, a chimaeric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO CC polypeptide in a sample suspected of containing PRO4993 polypeptide. CC similarly, PRO4993 polypeptide is useful for detecting PRO337 CC polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for detecting PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for linking a PRO725.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
